

KDPH MEASLES OUTBREAK VACCINATION RECOMMENDATIONS

FOR CHILDREN

AGE	# OF PREVIOUS VACCINE DOSES	MMR VACCINE RECOMMENDATIONS
0 - 6 months	0	✗ Vaccine is NOT recommended
6 - 11 months	0	✓ One early dose is recommended for those in outbreak areas or traveling internationally, after discussion with their health care provider ✗ This dose will not count as one of the two recommended childhood MMR doses
	0	
1 - 17 years	0	✓ Should receive first dose now and second dose at least 28 days later
	1	✓ Should receive a second dose of MMR vaccine at least 28 days after first dose ✓ The second dose may be given earlier than 4 years of age, as long as both doses are given after 12 months old and are separated by at least 28 days
	2	✗ Fully vaccinated; no additional doses recommended

FOR ADULTS

AGE	# OF PREVIOUS VACCINE DOSES	MMR VACCINE RECOMMENDATIONS
Before 1957	N/A	✗ Very likely exposed to measles as a child and considered immune; Vaccine not needed but may be given if desired
Between 1957-1968	0	✓ Should receive at least one dose. A second dose may be given based on patient's risk and desire at least 28 days after the first dose
	1 dose of inactivated MMR vaccine (or do not know what type they received)	
After 1968	1 dose of live attenuated (currently used type) MMR vaccine	✓ A second dose may be given based on patient's risk and desire at least 28 days after the first dose
	0	✓ Should receive at least one dose. A second dose may be given based on patient's risk and desire at least 28 days after the first dose
	1	✓ A second dose may be given based on patient's risk and desire at least 28 days after the first dose
All Adults at Increased Risk	2	✗ Fully vaccinated; no additional doses recommended
	International travel, healthcare personnel and those with close contact to areas where measles is spreading	✓ Anyone without presumptive evidence of immunity should get two doses at least 28 days apart

*MMR vaccine is **not** recommended during pregnancy or for severely immunocompromised people.
